Atikah Luthfiana 1506689250 APAP B Tutorial 05

## Penjelasan method latihan Select All Students

Hasil:

## **All Students**

No. 1

NPM = 123

Name = cinta

GPA = 3.45

#### Kuliah yang diambil

MPKT-6 sks

Delete Data Update Data

No. 2

NPM = 124

Name = euis

 $\mathbf{GPA} = \mathbf{3.55}$ 

### Kuliah yang diambil

- PSP-4 sks
- SDA-3 sks

Delete Data

- Mengubah methos selectAllStudent yang ada di StudentMapper

```
@Select("select npm, name, gpa from student")
@Results(value = { @Result(property = "npm", column = "npm"), @Result(property = "name", column = "name"),
@Result(property = "gpa", column = "gpa"),
@Result(property = "courses", column = "npm", javaType = List.class, many = @Many(select = "selectCourses")
List<StudentModel> selectAllStudents();
```

Sehingga masing-masing student yang di select di hubungkan dengan jenis mata kuliah yang di ambil

Selanjutnya mengubah viewAll.html

Sehingga hasil dari query Results dan Result dapat dipetakan ke dalam html

Atikah Luthfiana 1506689250 APAP B Tutorial 05

## Penjelasan untuk menambahkan View pada Course

#### Hasil:

ID = CSC126

Name = MPKT

Credits = 6

## Mahasiswa yang mengambil

- 123-cinta
- 23456-rangga jahad
- 67899-Budi baik
- Pertama diperlukan sebuah class yang memodelkan sebuah course dalam database dengan menggunakan CourseModel yang telah dibuat sebelumnya. Class inimenggambarkan object course yang berisi atribut-atribut yang ada pada tabel course di database yaitu id\_course, name, dan credits serta List yang berisi npm mahasiswa yang mengambil course tersebut

- Menambahkan membuat interface CourceService

Di dalam interface StudentService dibuat abstract method untuk melakukan select course berdasarkan id course

Membuat courseMapper yang berfungsi untuk memetakan hasil select database

```

 ▶ 🕅 static
                                                     CourseModel selectCourse(@Param("id") String id);
  <> course-not-found.html
                                                     <> delete.html
                                                     + "on studentcourse.npm = student.npm " + "where
List<StudentModel> selectStudent(@Param("id") String id);
```

Pada studentMapper kita membutuhkan query selectCourse untuk mendapatkan suatu course dengan id\_course tertentu. Pada selectStudent, query yang dihasilkan merupakan nama-nama mahasiswa yang mengambil mata kuliah yang telah di-select pada method selectCourse

- Selanjutnya dibuat StudentServiceDatabase

    ▶ 🛅 static
                                                                                                                                                                      model.addAttribute("course", course);
     "viewCourse";
             <> course-not-found.html
            <> delete.html
                                                                                                                                                                     model.addAttribute("id", id);
             <>> form-add.html
                                                                                                                                                                     return "course-not-found";
             <> index.html
              <> not-found.html
```

Method viewCourse akan mencari course berdasarkan id course yang ada di url ke dalam database dengan bantuan courseMapper. Jika course ditemukan, maka hasil request mapping akan di transfer ke viewCourse.html. Namun, jika course tidak ditemukan akan di arahkan ke course-not-found yang berisi informasi bahwa course yang dicari tidak ditemukan.

**Tutorial 05** 

- Membuat course-not-found.html untuk memberikan informasi kepada user bahwa course yang dicari dari query ke database tidak ditemukan

```
C:\Users\user\Documents\atikah's\APAPTutorial05\src\main\resources\templates\course-not-found.html (APAPTutorial05) - Sublime Text (UNREGISTERED)
File Edit Selection Find View Goto Tools Project Preferences Help
        /* CourseModel.java
      /* StudentModel.java
                                                  k!DOCTYPE html>
     ▼ 📻 service
                                                   .
<html xmlns:th="http://www.thymeleaf.org">
        /* CourseService.iava
       /* CourseServiceDatabase.java
                                                            <title>Course not found</title>
       /* StudentService.java
        /* StudentServiceDatabase.java
                                                             <h1>Course not found</h1>
      /* ApapTutorial05Application.java
                                                             <h3 th:text="'ID = ' + ${id}">Course ID</h3>
 ▼ 📄 resources
  ▶ 📗 static
  <> course-not-found.html
     delete.html
     <> form-add.html
```

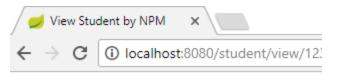

- Terakhir, membuat viewCourse.html untuk memetakan hasil query yang didapatkan untuk ditampilkan ke user

```
🌌 C:\Users\user\Documents\atikah's\APAPTutorial05\src\main\resources\templates\viewCourse.html (APAPTutorial05) - Sublime Text (UNREGISTERED)

Atikah Luthfiana 1506689250 APAP B Tutorial 05

# Hal yang Dipelajari dari Tutorial 05

NPM = 123

Name = cinta

GPA = 3.45

# Kuliah yang diambil

MPKT-6 sks

Pada tutorial kali ini saya belajar mengenai anotasi Results dan Result. Anotasi @Result digunakan untuk memetakan hasil query select ke class model dari hasi query yang dilakukan oleh anotasi @Results. Sehingga kita dapat memetakan hasil query dari suatu method ke dalam suatu list tertentu.
